OLECRANON FRACTURE OPEN REDUCTION INTERNAL FIXATION PROTOCOL

	SPLINT	RANGE OF MOTION	EXERCISES
PHASE I 1-6 weeks	 4-5 Days: A posterior long arm splint with elbow in 90 degrees flexion, forearm and wrist neutral is fabricated 2 Weeks: Continue splint 	Patients are maintained in the posterior mold splint for 2 weeks full time with no ROM. 2 Weeks: ROM is begun with no elbow flexion beyond 90. Passive extension only then put brace back on. May add on elbow flexion after 4 weeks. <i>Elbow flexion is limited to 90</i> <i>degrees for first 4 weeks</i>	2 - 6 Weeks: Gravity-assisted elbow extension forearm pronation/supination is begun. If the therapist believes AROM is progressing slower than planned and wishes to proceed early with PROM, please contact physician. Assisted PROM usually not begun until 6 weeks.
PHASE II 6 weeks	Weaned out over 2 weeks		Continue as above, but may now add passive motion and static progressive extension splinting is added as needed. Add gentle progressive strengthening of elbow and forearm.
PHASE III 8-10 weeks			Gradual return to full activity by 10 weeks
